	Spoken language recognition	Written language recognition	Identification of patterns in the text	Causal analysis
<b>Actor</b>	Coefficient on spectrogram for particular frequency	Property of specific stroke: On the top, at the bottom, long, short, skewed, etc.	Object property value: Name “John”	Specific actor: John Doe
<b>Event</b>	Combination of coefficients on spectrogram	Period or stroke composing the letter: .	Object class instance: Name “John”, surname “Doe”	Specific event: John Doe cleaning the window on the second floor.
<b>Coincidence</b>	Specific sound	Coincidence: i	Co-occurrence of object of class person properties: “John Doe”	Specific coincidence: Window on the second floor is dirty, John Doe is cleaning it.
<b>Process</b>	Specific spoken word	Specific written word: ping	Specific phrase: “John Doe cleans the window”	Specific process: Window on the second floor was dirty, John Doe has cleaned it and now it is clean.
<b>Role</b>	Pitch frequency	Property of symbol: orientation, extent, symmetry, etc.	Domain of the object class property: person’s surname	Typical role: Cleaner
<b>Appearance</b>	Spectral cluster on the spectrogram	Element of symbol: .	Class of the variable object: person	Typical appearance: Someone cleaning something
<b>Situation</b>	Sound of speech	Symbol: i	Pattern variable: \$subject	Typical situation: Someone is cleaning something which is dirty.
<b>Scenario</b>	Spoken word accordingly to the language model	Written word: ping	Phrase pattern: “\$subject cleans \$object”	Typical scenario: Something was dirty, someone has cleaned it, it is clean now.

# Evgeni Vityaev's Invariant Structures

Mining temporally invariant structures (“scenarios”) in historical time series data recording financial “processes” with the **Discovery** system.

## Contrastive Evaluation: Test Specific Phenomena

To test if your LM knows something very specific, you can use contrastive examples. These are the examples where you have several versions of the same text which differ only in the aspect you care about: one correct and at least one incorrect. A model has to assign higher scores (probabilities) to the correct version.

The roses in the vase by the door ? Competing answers: is, are

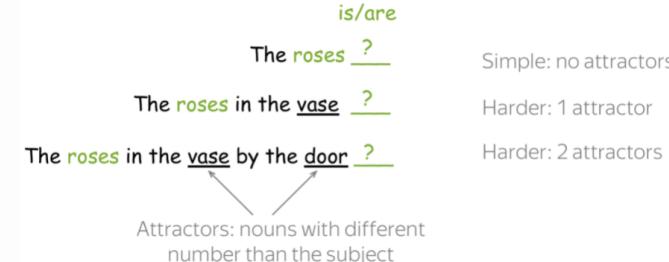

P(The roses in the vase by the door are) ↗

P(The roses in the vase by the door is) ↗

Is the correct answer ranked higher?  
 $P(\dots\text{are}) > P(\dots\text{is})$ ?

A very popular phenomenon to look at is subject-verb agreement, initially proposed in the [Assessing the Ability of LSTMs to Learn Syntax-Sensitive Dependencies](#) paper. In this task, contrastive examples consist of two sentences: one where the verb agrees in number with the subject, and another with the same verb, but incorrect inflection.

Examples can be of different complexity depending on the number of attractors: other nouns in a sentence that have different grammatical number and can “distract” a model from the subject.

[https://lena-voita.github.io/nlp\\_course/language\\_modeling.html](https://lena-voita.github.io/nlp_course/language_modeling.html)

# Claims

**Transition Freedom (TF)** appears to be superior (over **Mutual Information** and **Conditional Probability**) for unsupervised text segmentation (tokenization).

English and Russian require one specific way (variance) of handling the TF while Chinese requires a bit different specific way (derivative-based “peak values”) for the same purpose.

Tokenization quality for Russian and English may be as high as  $F1=0.96-1.0$ , depending on training and testing corpora while for Chinese the minimum is  $F1=0.71-0.92$ , depending on the assessment assumptions.

Larger training corpora does not necessarily effect in better tokenization quality, while compacting the models eliminating statistically weak evidence typically improve the quality.

TF-based tokenization appear quality same or better than lexicon-based one for Russian and English while for Chinese appears the opposite (as it could be anticipated).

Doing Russian and English tokenization with removed spaces makes the situation similar to Chinese with reasonable quality on lexicon-based tokenization but much worse results on TF-based one.

# Unsupervised Text Segmentation (Tokenization)

The father told the mother that the child was right.

Threshold 0.15

父亲告诉母亲，孩子是对的。

[ '父亲', '告诉', '母亲', '，', '孩子', '是', '对', '的', '。' ]

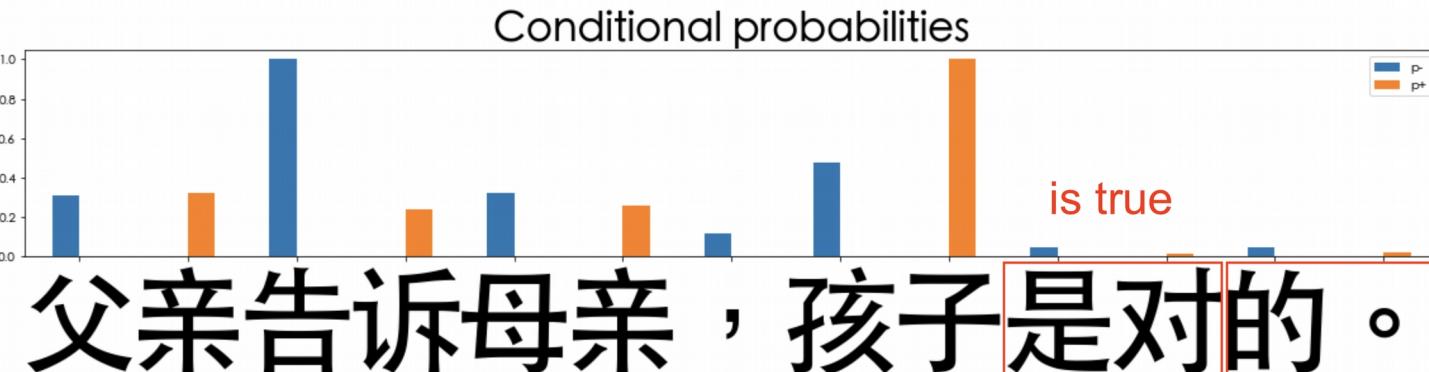

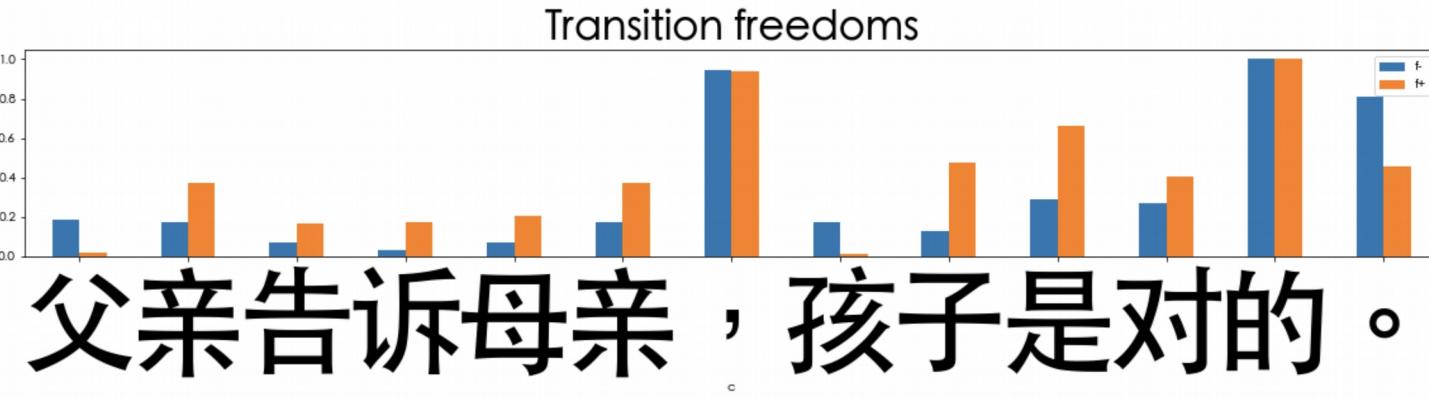

[ '父亲', '告诉', '母亲', '，', '孩子', '是', '对', '的', '。' ]

1.0

## Metrics/Indicators:

Transition  
Freedom  
Deviation

Conditional  
Probability  
(of Transition)

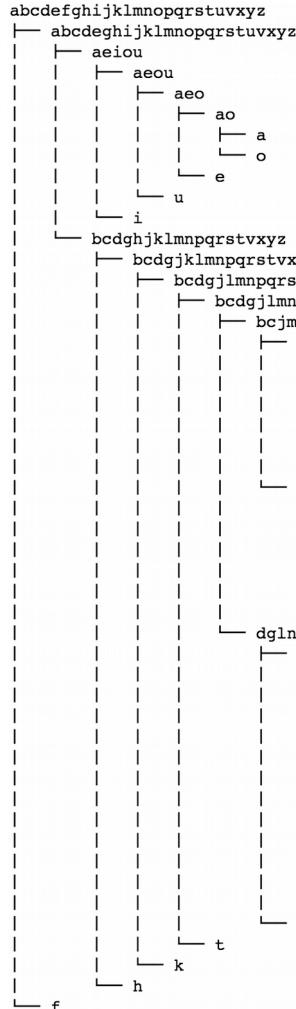

# Results – Freedom-based Tokenization against Lexicon

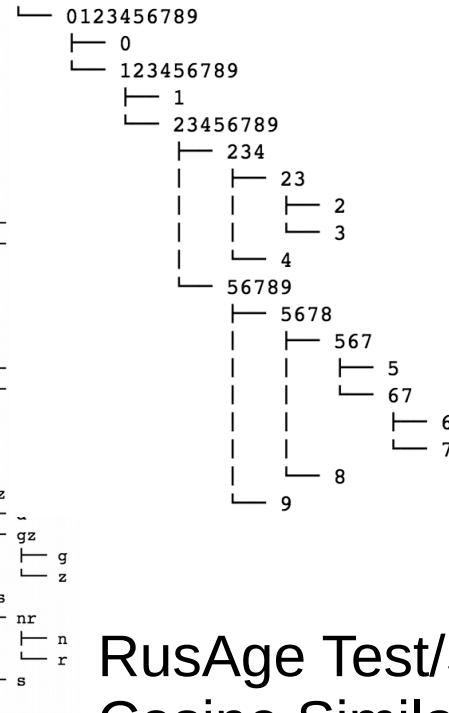

Language	Tokenizer	Tokenization F1	Lexicon Discovery Precision
English	Freedom-based	<b>0.99</b>	<b>0.99</b> (vs 1.0)
English	Lexicon-based	0.99	-
English no spaces	Freedom-based	0.42	-
English no spaces	Lexicon-based	0.79	-
Russian	Freedom-based	<b>1.0</b>	<b>1.0</b> (vs 1.0)
Russian	Lexicon-based	0.94	-
Russian no spaces	Freedom-based	0.26	-
Russian no spaces	Lexicon-based	0.72	-
Chinese	Freedom-based	<b>0.71</b>	<b>0.92</b> (vs 0.94)
Chinese	Lexicon-based	0.83	-

*Lexicon-based Tokenization - greedy/beam search on word length (optimal) or frequency*

# Conclusion and Further Work

Unsupervised Tokenization based on Transition Freedom (TF) recall and precision appears good enough as initial approximation for further applications of self-reinforcement learning as part of interpretable unsupervised learning of natural language.

Optimal thresholds and specific TF-based metrics are specific to language. The process and policy of their discovery and adjustment should be further explored.

Clustering or parts of speech on space of transition graphs may provide some insights on morphology and punctuation structure of low-resource and domain-specific languages.

Hybridization of TF-based tokenization approach with lexicon-based one might be efficient for low-resource and domain-specific languages.

Further unsupervised grammar learning experiments can be run on the basis of suggested unsupervised tokenization approach.

Applications for other Experiential Learning environments, including the ones with delayed/sparse feedback.

Using Reinforcement Learning techniques with self-reinforcement on historical data under Unsupervised Learning setup.
